6840 Series RF & Microwave System Analyzer

AEROFLEX
A passion for performance.

6840 series Microwave System Analyzers provide an integrated solution to component and subsystem testing

- Integrated synthesized source, scalar and spectrum analyzer
- 3 GHz, 8.4 GHz, 20 GHz, 24 GHz, 40 GHz and 46 GHz frequency versions
- Precision scalar network measurements with high dynamic range
- Spectrum analyzer with full range tracking generator
- Offset tracking on network measurements
- Group Delay option
- FM option
- Complete solution to comprehensive component and subsystem characterization
- Real time transmission line Fault Location with 0.1% accuracy
- EEPROM corrected scalar detectors for accurate measurements
- Applications interface allows guided and automatic testing
- Modular design for rapid service
- 3.5 in disk drive for results storage

The 6840 series RF and microwave system analyzers are a powerful new tool for the microwave industry. Integrated into a single instrument are a synthesized source, a three input scalar analyzer and a synthesized spectrum analyzer. The internal source can be used as a simple CW output, as a

swept source for scalar measurements, as a tracking generator with the spectrum analyzer and as an offset tracking source for network measurements on frequency translation devices.

This flexibility simplifies a range of previously complex but commonly made measurements. The receiver in the spectrum analyzer can be used as a tuned input for high dynamic range scalar measurements. The FM option adds frequency modulation to the source. The Group Delay option allows simultaneous measurement and display of group delay and amplitude response, and includes the frequency modulation option.

1 Series - 8 Instruments

The range covers five frequency bands in various convenient combinations of source and spectrum analyzer frequencies, enabling for example the harmonic content of microwave radios to be measured.

Synthesized Source

The synthesized source has low phase noise and 1 Hz frequency resolution. VCOs are used for frequencies above 3 GHz and an integrated RF synthesizer for the 1 MHz to 3 GHz range. Optionally increased output power is available from 3 to 24 GHz. Internal filtering results in excellent harmonic performance of -55 dBc for improved scalar measurement accuracy. Optional step attenuators are available to set low output powers for amplifier or receiver testing.

In CW mode the source can be used for local oscillator substitution. A power sweep is provided for amplifier gain compression testing. External FM can be applied by connecting a generator to the rear panel. With the FM option, an internal generator provides frequency modulation of the source.

When used with the scalar analyzer the source provides a swept synthesized output for frequency characterization of components and systems. It can also be used as a spectrum analyzer tracking generator to 46 GHz. The source can be set to any frequency offset or frequency multiple of the receiver tuned input. This powerful feature simplifies measurements of mixers, upconverters and down-converters that have frequency translation.

Scalar Analyzer

The three input scalar analyzer provides network characterization of components and systems. Simultaneous measurement of insertion and return loss are displayed on the 6840 color screen. Excellent measurement accuracy is assured by the use of EEPROM corrected detectors. Each detector is individually characterized for linearity and frequency response to provide a measurement accuracy close to that achieved with a power sensor. A range of autotesters with high directivity is available for return loss measurements.

It is also possible to make scalar measurements with a tuned input. A tuned input gives improved dynamic range. Insertion loss measurements of >80 dB are possible.

Bandpass filter insertion loss measurement

Spectrum Analysis

The 6840 variants contain an integral synthesized spectrum analyzer with 3 MHz to 1 kHz resolution bandwidth filters, >80 dB instantaneous dynamic range and an excellent 3rd order intermodulation intercept point. 6840 series are designed to make routine spectrum measurements on RF and microwave components, subsystems and systems.

Continuous full band sweeps simplify harmonic and spurious meas-

urements. The low distortion front end combined with wide dynamic range ensures that even on full span sweeps, spurious measurements to better than -60 dBc can be performed. High sensitivity at microwave frequencies is ensured by the use of wideband oscillators, this reduces the harmonic number used in the front end mixer.

The spectrum analyzer is fully featured with FM demodulator and built in loudspeaker. This is ideal for locating and identifying the source of interfering transmissions. Individual signals can be precisely identified by use of the internal frequency counter.

Amplifier intermodulation measurement

Optimized operation is provided by the coupling of the fundamental analyzer parameters of resolution bandwidth, sweep speed, video filter and input attenuation. These parameters are automatically set for optimum sweep speed and dynamic range. For specific applications the user can manually override the coupled functions.

Autotune automatically sweeps the full span of the spectrum analyzer and then displays the largest signal at the center and top of the screen. Markers can also be used to select any signal and display it at the center of the screen.

The integral source enables network measurements in normal tracking mode or by applying a frequency offset and/or multiplication factor. Any frequency offset can be supported. This facility makes measurements faster and easier than assembling together separate instruments and a PC controller.

External mixers extend the frequency range to 110 GHz.

Fault Location

Fault location software is standard on all 6840 series instruments. Many modern communication systems rely on a coaxial or waveguide feed between the transmitter and antenna. The fast fault location facility of the 6840 can quickly locate the position of faults causing poor return loss in the feed, which can seriously impact system performance.

Measurement resolution and accuracy is assured by the use of a synthesized source with up to 1601 measurement points.

Fault location measurement of a coaxial feed and antenna

Group Delay

The Group Delay option allows the simultaneous measurement and display of group delay and amplitude response over the full frequency range of the instrument. Components and assemblies including frequency translation devices can be readily characterized for ripple and variation from linear and parabolic variation using the powerful and easy to use marker functions. Measurement in any operator-specified sub-band within the passband can be displayed as maximum peak to peak ripple in both amplitude and group delay, maximum slope and maximum rate of change of slope.

Amplitude and delay response of a filter

Simplified User Interface

Integration of a source, spectrum analyzer and scalar analyzer into a single instrument has many benefits. The operator uses a single interface to set up any measurement. This saves time and is easier than writing software to perform complex measurement tasks, such as frequency offset network measurements.

Eight softkeys give rapid access to all commonly used parameters. Softkeys are shaped to inform the user of the action that the key will perform, e.g. enter data, select from list, move to another menu or immediate action. All commonly accessed functions are no more than one level deep, so that the instrument operation is easily learnt.

Applications Interface

An applications interface is built into the 6840 series which allows the user to create their own measurement routines and guide the operator through the test procedure. For example it can display on the 6840 screen how to set up the measurement, lead the operator through a calibration, show where to connect the device under test and then test the device's performance against predefined limits. The applications facility can reduce the incidence of operator error, improve measurement repeatability, provide guidance to infrequent users or simplify complex test procedures.

Color Display

A large TFT color display is fitted to the 6840 as standard displaying up to four measurements on two channels. Scalar and spectrum measurements can be displayed simultaneously on independent channels. Alternatively two spectrum channels can be shown with a wide and narrow frequency sweep. This could be used to scan a frequency spectrum for interfering signals whilst simultaneously displaying the wanted carrier.

Dual channel display, showing wide band and narrow band frequency sweeps

Comprehensive Markers

Up to eight markers are available. The marker menus provide the tools that are most commonly used in each of the measurement modes.

Harmonic measurement with dynamic marker table

In spectrum mode the markers identify the frequency and level of a signal, position signals on the display and measure relative signal values. A peak search feature places markers on the eight highest signals displayed for spurious signal identification. A table displayed below the traces shows the values of all eight markers dynamically.

In scalar mode markers automatically calculate peak to peak ripple, N - dB bandwidth, -1 dB compression point and find the maximum and minimum signal levels. This simplifies device characterization and reduces test time.

For fault location measurements the next peak left/right feature identifies the position and magnitude of each of the discontinuities along the transmission line. The peak find softkey quickly locates the biggest discontinuity on the line.

Fast Field Repair

6840 has a modular architecture with modules slotted onto a common mother board. In the event of a module failure the instrument can be

repaired by module replacement to reduce instrument downtime. Following a repair, software routines realign the replaced module.

Future Proof

The 6840 series microwave system analyzers have been designed to expand and adapt to changing test requirements. A standard instrument has capacity for additional modules. As future options are added, the flexibility and capability of the 6840 platform will expand. This ensures that investment made in the 6840 series today will provide a basis for future test needs.

For Design Engineers

For designers of components and subsystems the 6840 provides a powerful and flexible analysis tool. Devices such as filters, amplifiers, mixers, attenuators and oscillators can be characterized with a single test instrument. This flexibility reduces design cycles as the need to make instrument interconnections is reduced. 6840 has a low noise source for LO substitution and swept frequency measurements. The use of EEPROM detectors ensures accurate scalar measurements. Amplifiers can be precisely characterized for gain compression, output power and frequency response. The use of a tuned input can give >80 dB dynamic range for filter testing and the accessory autotesters, with 40 dB directivity, ensure accurate return loss results. The spurious and harmonic output of oscillators can be measured with the wide span high dynamic range spectrum analyzer.

Manufacturing Test

To the production manager the 6840 offers reduced programming time, reduced test time and simplified archiving of results. 6840 is fully compliant with the IEEE 488.2 GPIB standard. A full 401 data points can be transferred over the GPIB in typically <50 ms. Individual data points can be repetitively read in typically 10 ms. This enables full results archiving with minimal time penalty.

A single instrument replaces 'rack and stack' alternatives which makes program generation simpler. Rack space is also reduced.

Continuity of test is essential in a production environment. A failed test system can result in expensive loss of output. 6840 with its field replaceable modules minimizes any output loss due to test system failure.

Installing and Maintaining Systems

During the installation period of a microwave system it is always necessary to revalidate key parameters. 6840 provides a comprehensive solution for installation teams. It is housed in a ruggedized case, has secure handles and can be supplied with a protective carrying case.

For systems with long waveguide or coaxial feeds the 6840 is used by the installation team to measure return loss and if necessary fault location. The synthesized source with 1601 measurement points ensures precise fault location measurements. The 6840 series provides a tuned input that can be used for return loss and fault location measurements. This measurement technique rejects interfering signals from other transmitters, a common cause of poor measurement performance in the field.

By archiving results onto disk, or the internal instrument memory, the 6840 forms the basis of a preventative maintenance system. Experience shows that degradation in the antenna feed is the major source of system field failures. 6840 has the accuracy to monitor and

identify gradual system degradation with time.

Results Logging and Outputting

Measurement results can either be saved to internal non-volatile memory or to 3.5 in disk. Traces saved onto disk can then be archived or imported into a spreadsheet for viewing.

An alternative method for displaying results in a standard word processor document or in a graphics package is to use the optional MIPlot software. MIPlot captures the measurement data either via the GPIB or from a saved trace on disk. This data can then be embedded into a document and reformatted, colors changed, markers and text added.

AC detection 80 dB

Distance Accuracy

3 mm or 0.1% of range for a single fault

Transmission Line Database

Data supplied as standard

Required Accessory

624X series fault locator

or 658X series transmission line test head

or divider

GROUP DELAY

Measurement Range

± 1 μ s to ± 10 μ s

Resolution* (3 MHz aperture)

0.1 ns to 15 GHz

0.2 ns 15 to 30 GHz

0.3 ns 30 to 40 GHz

Absolute Accuracy* (3 MHz aperture)

± 0.5 ns, 10 MHz to 24 GHz

± 2.5 ns, 24 GHz to 40 GHz

*excluding effects of imperfect match

Relative Accuracy (for peak to peak measurement)

As Resolution (typical)

Scales

0.1 ns/div to 5 μ s/div in a 1, 2, 5 sequence with increment keys

Keypad entry provides user scaling

Reference delay

Defaults to zero, user selectable

Reference position

User selectable, default is centre display

Delay offset

User entry of offset value

Trace displays

Simultaneous amplitude and group delay vs frequency

Absolute delay and "zoom" display vs frequency

Dual channel mode

Comparison over same frequency range at same centre frequency

Comparison over different centre frequencies

FREQUENCY STANDARD

Internal 10 MHz OCXO

Drift

± 5 in 10^8 over 0 to 55°C

Ageing

± 2 in 10^7 per year (OCXO)

External Frequency Standard

1 MHz or 10 MHz

Connector: BNC

REAR PANEL CONNECTORS

RS-232

9 way D-type connector, male
Baud rate 300 to 9600

GPIB Interface

GPIB is IEEE 488.1 and 488.2 compatible. The interface has 2 functions.
-Instrument control with full Talk/Listen capability
-Control of plotter using HPGL. Plotter is buffered to permit measurements to proceed whilst plotting.

10.7 MHz IF Output (from Spectrum Analyzer)

Connector: BNC

Frequency Standard In/Out BNC

10 MHz input or 10 MHz output selectable from front panel

Mod In/Out BNC

Mod in/out

Rear panel BNC connector, TTL level. Impedance approx 100 Ω

Printer Output

25 way D-type connector
Parallel interface.
Drivers supplied for PCL DeskJet and LaserJet printers. Printer is buffered to permit measurements to proceed whilst printing.

External Monitor

Standard VGA, 640 by 480 color output
15 way high density D-type female connector

Voltage Output (Auxiliary 9-pin Connector)

Settable for 0 to 10 V ramp, fixed voltage or chart recorder drive

Video Output (Auxiliary 9-pin Connector)

Output from spectrum analyzer detector
Bandwidth: as per RBW setting

External Levelling Input

Input voltage range: 0 to +1 V
Connector: BNC

GENERAL FEATURES

Number of Display Channels 2

Number of Measurements 4 (2 per display channel)

Number of Measurement Points 2 to 1601 for one trace, scalar
512 fixed, spectrum

Display Color active matrix TFT liquid crystal display with 16.5 cm (6.5 in) visible diagonal

Data Storage 3.5 in floppy disc drive, 1.44 Mb. Trace storage in DOS format.

Limits

4 stores of 12 segments each. Each segment defines an upper limit, upper and lower limits, or a point. Any store can be applied to any trace.

MARKERS

8 per trace plus separate delta marker

Marker Functions

Marker, delta marker, minimum, maximum, search left, search right, N-dB bandwidth (with center frequency), marker tracking.

Spectrum Analyzer

Find Peak / Next Peak (next highest amplitude or next Left / Right) / Identify Peaks
MKR to CF
MKR to Ref Level
Counter / Set Resolution
Measure Relative to Carrier (dBc)
Search Left / Right
Delta MKR / Set Span / Fixed Delta

Scalar Analyzer

Active marker Max / Min
Max / Min Tracking
Find PK-PK
PK-PK Tracking
Search Right / Left
Bandwidth / Optional CF / DF (Q)
dB / Octave, dB / Decade Readout
Delta Marker On / Off
-1 dB Gain Compression
Peak to peak delay between two markers
Max peak to peak delay in a user defined bandwidth
Deviation from linear between two markers
Deviation from parabolic between two markers

Fault Location

Find Max / Track Max
Next PK Right / Left
Set PK Level
Delta marker On / Off

General

Marker Table
Assign Active MKR / Position Active MKR
Set-up Markers (i.e. On / Off, Position)
Large Readout
All Off

Marker Resolution

Frequency: 6 digits or 1 Hz, user selectable
Power: 0.01 dB
Voltage: 1 nV

Measurement Manipulation

Display live measurement.
Display trace memory.
Display live measurement relative to trace memory.
Measurement hold may be applied for each trace.
Any input or ratio of inputs may be assigned to any one or more than one trace(s). A trace may display absolute power, power relative to a path calibration or power minus a trace memory.

Input Offsets

An offset in the range -99.99 dB to +99.99 dB in 0.01 dB steps may be applied per detector input.

Weight - Variant and Option Dependent

24 kg (53 lb)

Size (Not including front handles)

230 mm H x 430 mm W x 570 mm D
9 in H x 17 in W x 22 in D

Power Supply

100-240 V~ (Limit 90-264 V~)

50-60 Hz (Limit 45-66 Hz)

108-118 V~ (Limit 90-132 V~)

50-400Hz (Limit 45-440 Hz)

300 W Maximum

Rated Range of Use

Temperature 0 to 50°C

6845 and 6845R only +5 to 45°C

Humidity Up to 93% RH at 40°C

Conditions of Storage and Transportation

Temperature -40 to +71°C

Humidity Up to 93% RH at 40°C

Altitude Up to 4570 m (15000 ft)

Electromagnetic Compatibility

Conforms with the protection requirements of the EEC Council Directive 89/336/EEC. Conforms with the limits specified in the following standards:

IEC/EN61326-1 : 1997, RF Emission Class B, Immunity Table 1, Performance Criteria B

Safety

Conforms with the requirements of EEC Council Directive 73/23/EEC (as amended) and the product safety standard IEC/EN 61010-1 : 2001 + C1 : 2002 + C2 : 2003 for class 1 portable equipment, for use in a Pollution Degree 2 environment. The instrument is designed to be operated from an Installation Category 2 supply.

Note : All specifications quoted are for operation at calibration temperature $\pm 3^{\circ}\text{C}$.

Specifications involving Type N connectors above 18 GHz are not traceable to national standards as these do not exist at present.

Specifications involving 2.92 mm connectors above 40 GHz are not traceable to national standards as these do not exist at present

Typical specifications are non-warranted.
