

NAV2000R -50, -80 & -TA FAQ

Q. What is the major difference of the NAV2000R P/N 01-0520-TA and the -50 & -80?

A. The NAV2000R -TA is a semi-custom version of the -50 unit. It has the same specifications but does not have the Reverse Power Protection module. Some OEM Nav radios with certain types of antenna fault detection will see the RPP module as a faulty antenna. The user, however, must be aware that an errant transmission from the radio will damage the NAV2000R. The -80 version has a high power RF output.
